Experiment 1: Regular Expressions in Python

Aim:

To demonstrate how to use regular expressions in Python to match and search for patterns in text.

Algorithm:

1. Import the re module.
2. Read the input text.
3. Define a regular expression pattern.
4. Search the text using re.search().
5. Display the matched pattern if found.

Python Code:

```
import re

text = input("Enter the text: ")
pattern = input("Enter the pattern: ")

match = re.search(pattern, text)

if match:
    print("Pattern Found:", match.group())
else:
    print("Pattern Not Found")
```

Output:

Output

```
Enter the text: My phone number is 9876543210
Enter the pattern: \d{10}
Pattern Found: 9876543210
```

```
=== Code Execution Successful ===
```

Result:

The program successfully matched and searched the required pattern using Python regular expressions.
